

Consensus statement from the RACC  
International Advisory Committee and  
presenters following the  
RACC-13 Symposium held on  
October 1, 2021

## **Addressing Our Planetary Crisis**

The Earth's climatic, ecological, and human systems are converging towards an existential crisis for global civilization within the lifetimes of children now living. Precursors of that crisis are already evident and likely to be further amplified as human population peaks around the end of the 21st century. A year ago, the statement from the Regional Action on Climate Change (RACC) Symposium declared "2020 is the year when humanity is experiencing ...converging impacts of climate change, biodiversity loss, pollution, inadequate global health infrastructures, and stark inequalities" (Falk et al 2020).

That reality is even more evident now. Current policies are projected to produce a rise of 3 deg or more above pre-industrial levels in less than 80 years. Accompanying impacts are described in compelling detail in the recent Intergovernmental Panel on Climate Change, Working Group 1 Report (IPCC 2021).

Taken together this represents a serious trend in declining planetary health. The existing implosion of biodiversity is accelerating, and significant new threats to food security and public health are emerging, stressed further by population growth, inequitable distribution and consumption of resources, and significant demographic shifts. Notably, but far from exclusively, through drought and unsustainable overdraft of groundwater in arid and semi-arid regions, the agricultural and food production on which billions of people are directly dependent is increasingly threatened. Many of these populations are already chronically malnourished and could face famine due to extreme poverty, displacement, climate change, and local conflicts. At the same time attempts to increase agricultural productivity using current approaches will

further degrade biodiversity and increase emissions leading to further global warming.

Old notions of national military and economic security are no longer adequate. The pandemic of 2020-2021 (SARS-CoV-2) has shown how local disease outbreaks create global risks, and distant outbreaks create local impacts. Other converging risks (for example to climate and biodiversity) are showing similar dynamics. As a result, stand-alone risk management strategies will become increasingly ineffective. Recent experience suggests that nations need now to work towards a much more comprehensive human security and sustainability action program addressing a complex system of multiple risks simultaneously. In order to avoid converging catastrophes we must confront multiple challenges with cross-disciplinary tools, transforming our societies in multiple ways and on multiple scales: locally, regionally and globally.

At its foundation in 2009 RACC-1 proposed the creation of specialized Knowledge-Action Networks (KANs) - intended to support adaptation to local and regional impacts of climate change. They were to be regionally specialized networks comprising international research specialists and regional and local decision-makers. KANs were intended to supply crucial relevant and trustworthy scientific knowledge applicable to decision makers at local and regional scale and to enhance their adaptive and coping capacity. This should lead to building resilience in the most vulnerable eco-regions (El-Beltagy 2019).

This year, following RACC-13, the starting point for effective action is still decisions based on trustworthy knowledge. But multiple risk convergence requires more of 'knowledge action' (networks of people and institutions to provide knowledge interacting with networks of people and institutions who influence, create, and implement policy). These networks need now to be more widely distributed geographically and capable of integrating more complex scientific knowledge and transmitting successful approaches in one region to others.

We believe a global initiative is required urgently to coordinate and increase the collaboration of existing relevant information hubs. This should be facilitated by appropriate human support and information technology and tasked with supporting multi-risk situational awareness for regional and local decision makers.

In anticipation of the need to support a broad security and sustainability action agenda, international agencies like the World Meteorological Organization (WMO), World Health Organisation (WHO), Food and Agriculture Organization (FAO), UN Water, Intergovernmental Oceanographic Commission (IOC) and others should be encouraged to further integrate their knowledge resources. The capability of the WMO's Global Earth Observation System of Systems (GEOSS) to support a comprehensive security and sustainability agenda should be developed. The pooling and integration of relevant data can begin in tandem with the development of more appropriate standardized and timely reporting and information systems and institutional, regulatory and governance structures.

RACC's role has been to urge that relevant policies and actions be thought through at both the global and regional levels together. Over more than a decade since RACC-1 relevant thinking has become more integrated. Mitigation and adaptation are now seen as complementary parts of the climate action agenda, biodiversity is being integrated into economic planning, and there is increasing interest in research in geo-engineering, whose acceptability depends on the progress (or lack thereof) in the other components of the security and sustainability agenda.

Key actions of this agenda in climate and biodiversity include accelerating, articulating and applying simultaneously at local, regional national and global scales decisions to:

**Mitigate Climate Change.** Decarbonise the world economy in the next 3 decades (reducing net emitted greenhouse gases to zero) and increase carbon drawdown (including by re-carbonization of world soils and vegetation).

**Conserve and restore biodiversity.** Adopt a goal of no net global loss of ecosystem services by 2035. This needs to be supported by increased broad protection for natural ecosystems and biodiversity through expansion of land, water, and ocean reserves and protection, restoration of damaged ecosystems and soils, regenerative agriculture, gene banks and policies protecting threatened and endangered species.

**Internalise into pricing the value of natural services.** In support of the above develop the necessary international institutions, accounting systems, financing, processes and agreements to reflect back into pricing the value

of currently unpriced natural services to support widespread investment into circular economies and nature-based solutions to ecological degradation (as developed in Dasgupta 2021).

**Build resilience and reduce societal exposure to those impacts which cannot be avoided.** Do this through clearly planned investment in infrastructure, nature-based solutions and capacity development that facilitate adaptation, disaster risk management, and support for and sustainable development of the most vulnerable. Prepare for and provide global support for investment in the protection, retreat, or relocation of vulnerable populations especially vulnerable to depleting resources and climate extremes.

**Identify effective protective and restorative options.** Accelerate research and analysis, but not currently deployment, of measures that might effectively reduce the speed and severity of soil degradation, biodiversity loss and climate change, including proposed methods for restoring biospheric processes, carbon drawdown, and regionally applicable albedo modification. Such investigations should be subject to best-available scientific analysis of potential risks and benefits. As do the US National Academies of Science (2021), we consider that careful governance (with representation of all stakeholders and incorporating ethics and justice considerations for future generations ) needs to be developed, and will be critical for determining what research, in what manner, and under what controls, such research may proceed.

The following are the authors of this statement:

1. Prof. Jim Falk (RACC-13 Chair) - Honorary Professorial Fellow, Melbourne Sustainable Society Institute, University of Melbourne, Emeritus Professor, University of Wollongong.
2. Dr. Faten Attig-Bahar, Steering Committee, Future Earth Water-Energy-Food Nexus; Tunisia Polytechnic School, University of Carthage, Tunisia.
3. Prof. Rita R. Colwell - Distinguished University Professor, Center for Bioinformatics and Computational Biology, University of Maryland College Park; Professor, Johns Hopkins Bloomberg School of Public Health.
4. Prof. Swadhin K. Behera, Director, Application Laboratory, Japan Agency for Marine-Earth Science and Technology (JAMSTEC); Professor, Department of Ocean Technology, Policy, and Environment, The University of Tokyo, Japan
5. Prof. Adel S. El-Beltagy Chair, Int'l Dryland Dev. Commission (IDDC); Prof. at Arid Land Agric. Graduate Studies & Res. Institute, Ain Shams Univ. Egypt; Board member of TWAS.
6. Prof. Joachim von Braun, President, Pontifical Academy of Sciences, Vatican City State; Professor for Economic and Technological Change and Director, Center for Development Research (ZEF), Bonn University, Germany
7. Prof. Sir Partha Dasgupta, Frank Ramsey Professor Emeritus of Economics, Faculty of Economics, University of Cambridge, U.K.
8. Dr. Peter H. Gleick - President Emeritus, Pacific Institute for Studies in Development, Environment and Security.
9. Prof. Ryuichi Kaneko, Professor, School of Political Science & Economics, Meji University; former Deputy Director-General, National Institute of Population and Social Security Research, Japan.
10. Prof. Charles F. Kennel - Distinguished Professor and Director Emeritus, Scripps Institution of Oceanography, University of California, San Diego (UCSD); Distinguished Visiting Scholar, Centre for Science and Policy, University of Cambridge.
11. Prof. Phoebe Koundouri, Professor and Director of ReSEES Research Laboratory, Athens University of Economics and Business; Director of Sustainable Development Unit and EIT Climate-KIC Hub Greece, Athena RC; Fellow World Academy of Art and Science; President-Elect of the European Association of Environmental and Resource Economists; Co-chair SDSN Europe & SDSN Greece.
12. Prof. Yuan Tseh Lee - President Emeritus, Academia Sinica [Nobel Laureate in Chemistry 1986].
13. Prof. Thomas E. Lovejoy – University Professor of Environmental Science & Policy, Department of Environmental Science & Policy, George Mason University; Senior Fellow, United Nations Foundation, U.S.A.
14. Dr. Amy Luers - Global Lead, Sustainability Science, Microsoft.
15. Prof. Cherry A. Murray - Benjamin Peirce Professor of Technology and Public Policy and Professor of Physics, Emerita, Harvard University; Deputy Director for Research, Biosphere2 and Professor of Physics, University of Arizona.

16. Prof. Rattan Lal, Distinguished University Professor of Soil Science, The Ohio State University; Director, CFAES Rattan Lal Center for Carbon Management and Sequestration, The Ohio State University, U.S.A.
17. Dr. Ismail Serageldin - Founding Director Emeritus, The Library of Alexandria.
18. Prof. Youba Sokona, Vice-Chair, IPCC; Member of the Board for the Institute of Development Studies; Honorary Professor at the University College London (UCL); and Special Advisor to the African Energy Leaders Group.
19. Prof. Kazuhiko Takeuchi - President, Institute for Global Environmental Strategies (IGES); Project Professor, Institute for Future Initiatives (IFI), The University of Tokyo.
20. Prof. Dr. Makoto Taniguchi, Deputy Director General, RIHN Center, Research Institute for Humanity and Nature (RIHN), Japan.
21. Dr. Chiho Watanabe – Professor/Executive Advisor to the President (Planetary Health), School of Tropical Medicine and Global Health, Nagasaki University; Professor Emeritus, The University of Tokyo; former President, National Institute for Environmental Studies (NIES).
22. Prof. Tetsuzo Yasunari, Senior Advisor and Professor Emeritus (former DG) of Research Institute for Humanity and Nature (RIHN), Kyoto; Director of Kyoto Climate Change Adaptation Center (KCCAC)
